218 Nature-Based Solutions: Innovations in Research and Application

Tuesday, 9:30am - 12:00pm

Location: Kent

Technical Community: NRES - Natural Resources & Environmental Systems

Session Type: Oral Technical Session

Description: Nature-based solutions (NBS) incorporate natural features and processes to protect or sustainably use land and water resources, while incorporating socio-environmental concerns to improve communities and the ecosystems they inhabit. NBS will become strategically important as risks increase to both natural and built systems from climate change and land use conversion. This session seeks to discuss research in NBS including novel NBS, quantification of benefits of NBS, policy aspects regarding the use or implementation of NBS, social considerations of NBS, and application/implementation of NBS, such as green infrastructure, land conservation, and coastal installations. We would welcome global presentations from industry and academia and from applications in all kinds of landscapes, including agricultural, urban, and mixed-use.

220 Ontario Perspective on Sustainable Manure Management-GUEST SPEAKERS

Tuesday, 9:30am - 12:00pm

Location: Birchwood Ballroom

Technical Community: NRES - Natural Resources & Environmental Systems

Session Type: Guest Speaker Session

Description: Manure land application can contribute to soil nutrient imbalances, particularly in regions that have many large-scale animal productions. When manure production exceeds the nutrient needs of surrounding fields, the excess can lead to environmental concerns, while transporting manure to more distant fields can be cost prohibitive. This session will address regional nutrient management issues, featuring experts from local government agencies, extension, research, and industry, who will share their perspectives and explore potential solutions. A newly developed manure treatment technology decision-support tool will also be presented. The session will conclude with a panel discussion, providing interactive dialogue and knowledge exchange opportunities.

239 Extreme Event Hydrologic and Water Quality Modeling

Tuesday, 2:30pm - 5:00pm

Location: Wentworth

Technical Community: NRES - Natural Resources & Environmental Systems

Session Type: Oral Technical Session

Description: Extreme events induced by climate change, including heavy precipitation, wildfires, droughts, frosts, storms, and rising sea levels in coastal areas, are profound in many parts of the globe and may pose a serious threat to water quality. For example, more intense and frequent precipitation events due to climate change increase soil erosion, which may significantly degrade water quality through increased turbidity and lead to deterioration of aquatic ecosystem health. Modeling-based approaches can help scientists understand and project the impact of extreme events on water quality. This proposed session will provide new scientific knowledge that can be employed by policymakers and practitioners to ameliorate the water quality impacts of extreme events.

ASE - Applied Science & Engineering

301 Sustainability in Circular and Carbon-Negative Biosystems

Wednesday, 7:30am - 10:00am

Location: Maple East/West

Technical Community: ASE - Applied Science & Engineering

Session Type: Oral Technical Session

Description: Achieving a circular economy is critical for a sustainable future, particularly in sectors that currently produce resource-intensive products in a linear fashion, such as food and agriculture. At the same time, carbon-negative technologies that remove atmospheric CO₂ must be developed and deployed rapidly in order to avoid the worst effects of climate change. Circularity and carbon removal are often assessed and discussed independently, even though they are highly intertwined. This session will explore conventional and emerging technologies and practices that synergize carbon removal within circular biosystems. A particular emphasis will be on assessing trade-offs between utilizing biomass for energy and carbon removal.

329 Conservation Drainage Practices – Current and Future Innovations

Wednesday, 10:15am - 12:15pm

Location: Maple East/West

Technical Community: NRES - Natural Resources & Environmental Systems

Session Type: Oral Technical Session

Description: Surface and subsurface drainage is crucial for the sustenance and profitability of agroecosystems in humid and arid climates. The shifting agro-climatic zones and expanding soil degradation issues have posed newer water management challenges for the conventional drainage infrastructure. Furthermore, by being a major hydrologic pathway of water in intensively drainage landscapes, agricultural drainage plays a major role in the transport of nutrients, sediment, and other pollutants to downstream water bodies. Within field, edge-of-field, and stream-level conservation drainage practices have emerged for solving the water management and environmental quality issues. This session invites submissions focused on current and future innovations in conservation drainage practices. Authors are encouraged to submit presentations based on (but not limited to) the following topics:

- Innovative conservation drainage approaches to address water quality issues at field-to-watershed scales (examples include controlled drainage, drainage water recycling, saturated buffers, woodchip bioreactors, phosphorus removal structures, two-stage ditch design etc.).
- Stacking of conservation practices to enhance efficacy, environmental impact, and/or economic feasibility.
- Case studies showing unique application of conservation drainage practices to address specific local/regional issues (e.g. practices for addressing legacy phosphorus losses).
- Model applications and/or improvements focused on conservation drainage practices assessment.
